

## Blockchain Experiment 4

**AIM:** Hands on Solidity Programming Assignments for creating Smart Contracts

### THEORY:

#### **Q1: Primitive Data Types, Variables, Functions - pure, view**

In Solidity, primitive data types form the foundation of smart contract development. Commonly used types include:

- **uint / int:** unsigned and signed integers of different sizes (e.g., uint256, int128).
- **bool:** represents logical values (true or false).
- **address:** holds a 20-byte Ethereum account address, often used for storing user accounts or contract addresses.
- **bytes / string:** store binary data or textual data.

Variables in Solidity can be

- **state variables:** stored on the blockchain permanently
- **local variables:** temporary, created during function execution
- **global variables:** special predefined variables such as msg.sender, msg.value, and block.timestamp

Functions allow execution of contract logic. Special types of functions include:

- **pure:** cannot read or modify blockchain state; they work only with inputs and internal computations.
- **view:** can read state variables but cannot alter them. This classification helps optimize gas usage and enforces function integrity.

#### **Q2: Inputs and Outputs to Functions**

Functions in Solidity can accept input arguments and return one or more output values. Inputs enable users or other contracts to pass data into the contract, while outputs make it possible to return results after computation.

For example, a function can accept an amount in Ether and return whether the transfer was successful. Solidity also allows named return variables, which improve readability and debugging.

#### **Q3: Visibility, Modifiers and Constructors**

Function Visibility defines who can access a function:

- **public:** available both inside and outside the contract.
- **private:** only accessible within the same contract.
- **internal:** accessible within the contract and its child contracts.
- **external:** can be called only by external accounts or other contracts.

Modifiers are reusable code blocks that change the behavior of functions. They are often used for access control, such as restricting sensitive functions to the contract owner (onlyOwner).

Constructors are special functions executed only once during contract deployment. They initialize important values, such as setting the deploying account as the owner of the contract.

#### Q4: Control Flow : if-else, loops

Control flow in Solidity is similar to traditional programming languages:

- **if-else** allows conditional decision-making in contract logic, e.g., checking if a balance is sufficient before transferring funds.
- **Loops (for, while, do-while)** enable repeated execution of code. For example, iterating through an array of users. However, loops must be used carefully, as excessive iterations increase gas consumption, potentially making the contract expensive to execute.

#### Q5: Data Structures : Arrays, Mappings, structs, enums

- **Arrays:** Can be fixed or dynamic and are used to store ordered lists of elements. Example: an array of addresses for registered users.
- **Mappings:** Key-value pairs that allow quick lookups. Example: mapping(address => uint) for storing balances. Unlike arrays, mappings do not support iteration.
- **Structs:** Allow grouping of related properties into a single data type. Example: struct Player {string name; uint score;}.
- **Enums:** Used to define a set of predefined constants, making code more readable. Example: enum Status { Pending, Active, Closed }.

#### Q6: Data Locations

Solidity uses three primary data locations for storing variables:

- **storage:** Data stored permanently on the blockchain. Examples: state variables.
- **memory:** Temporary data storage that exists only while a function is executing. Used for local variables and function inputs.
- **calldata:** A non-modifiable and non-persistent location used for external function parameters. It is gas-efficient compared to memory.

Understanding data locations is essential, as they directly impact gas costs and performance.

#### Q7: Transactions : Ether and wei, Gas and Gas Price, Sending Transactions

- **Ether and Wei:** Ether is the main currency in Ethereum. All values are measured in Wei, the smallest unit (1 Ether =  $10^{18}$  Wei). This ensures high precision in financial transactions.
- **Gas and Gas Price:** Every transaction consumes gas, which represents computational effort. The gas price determines how much Ether is paid per unit of gas. A higher gas price incentivizes miners to prioritize the transaction.
- **Sending Transactions:** Transactions are used for transferring Ether or interacting with contracts. Functions like transfer() and send() are commonly used, while call() provides more flexibility. Each transaction requires gas, making efficiency in contract design very important.

## TASKS PERFORMED:

### Tutorial 1: Introduction

#### a. get

The screenshot shows the Remix IDE interface. On the left, the 'DEPLOY & RUN TRANSACTIONS' panel is active. Under 'CONTRACT', 'Counter - remix-project-org/remix-w' is selected. The 'Deploy' button is orange, and 'At Address' is blue. Below, 'Transactions recorded' shows 7 transactions. 'Deployed Contracts' shows 'COUNTER AT 0x5E1...4EFF5 (M)' with a balance of 0 ETH. The 'get' button is highlighted in blue, and the 'get - call' button is also highlighted. The 'Low level interactions' section shows 'CALLDATA' with a 'Transact' button. The main editor on the right shows the Solidity code for the 'Counter' contract. The 'get' function is defined as follows:

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.3;
3
4 contract Counter {
5     uint public count;
6
7     // Function to get the current count
8     function get() public view returns (uint) { 2453 gas
9         return count;
10    }
11
12    // Function to increment count by 1
13    function inc() public { infinite gas
14        count += 1;
15    }
16
17    // Function to decrement count by 1
18    function dec() public { infinite gas
19        count -= 1;
20    }
21 }
```

The 'Explain contract' panel at the bottom shows a transaction call: '[call] from: 0x58380a6a701c568545dcfc803fc8875f56beddC4 to: Counter.get() data: 0x6d4...ce63c'.

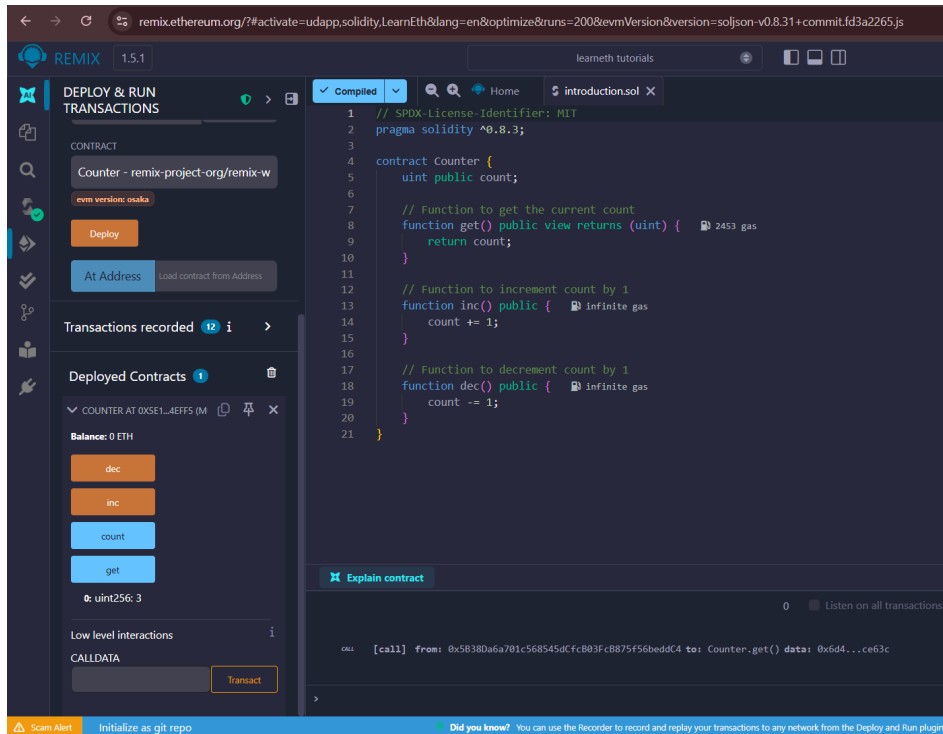

#### b. inc

The screenshot shows the Remix IDE interface. On the left, the 'DEPLOY & RUN TRANSACTIONS' panel is active. Under 'CONTRACT', 'Counter - remix-project-org/remix-w' is selected. The 'Deploy' button is orange, and 'At Address' is blue. Below, 'Transactions recorded' shows 11 transactions. 'Deployed Contracts' shows 'COUNTER AT 0x5E1...4EFF5 (M)' with a balance of 0 ETH. The 'inc' button is highlighted in orange, and the 'get - call' button is also highlighted. The 'Low level interactions' section shows 'CALLDATA' with a 'Transact' button. The main editor on the right shows the Solidity code for the 'Counter' contract. The 'inc' function is defined as follows:

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.3;
3
4 contract Counter {
5     uint public count;
6
7     // Function to get the current count
8     function get() public view returns (uint) { 2453 gas
9         return count;
10    }
11
12    // Function to increment count by 1
13    function inc() public { infinite gas
14        count += 1;
15    }
16
17    // Function to decrement count by 1
18    function dec() public { infinite gas
19        count -= 1;
20    }
21 }
```

The 'Explain contract' panel at the bottom shows a transaction call: '[call] from: 0x58380a6a701c568545dcfc803fc8875f56beddC4 to: Counter.get() data: 0x6d4...ce63c'.

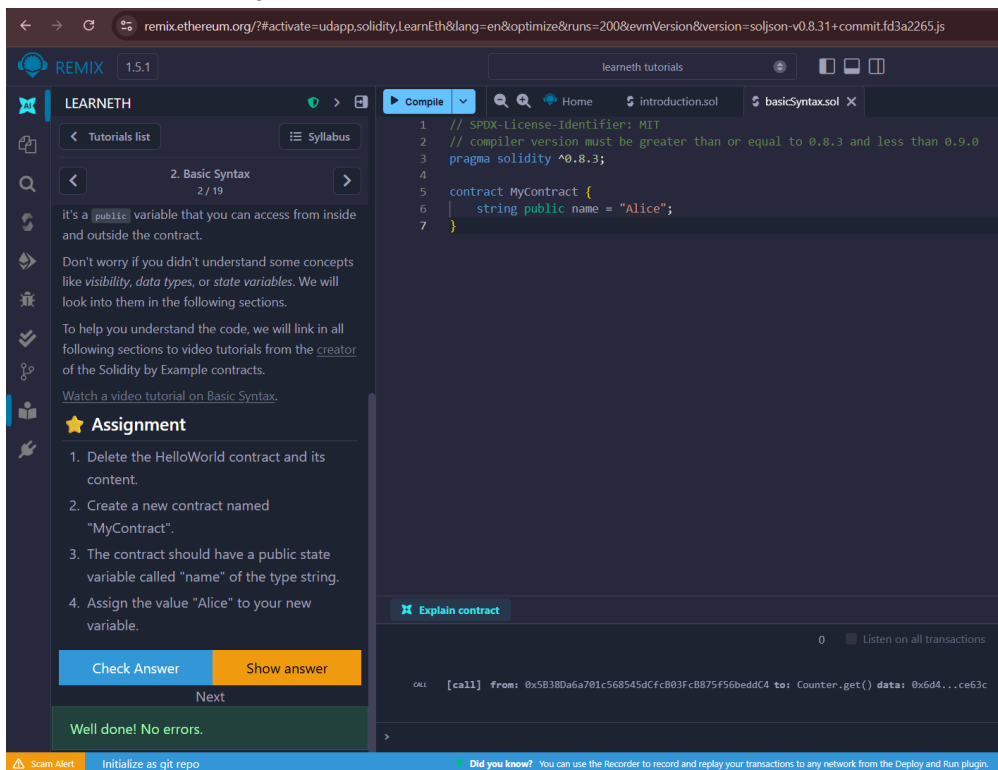

c. dec

The screenshot shows the Remix IDE interface. On the left, the 'DEPLOY & RUN TRANSACTIONS' sidebar is open, displaying the 'Counter' contract. The 'dec' function is selected, and its transaction log shows a successful call. The main editor displays the Solidity code for the 'Counter' contract, which includes a public state variable 'count' and three functions: 'get' (returns the current count), 'inc' (increments the count by 1), and 'dec' (decrements the count by 1). The bottom panel shows the transaction log with a call to 'Counter.get()'.

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.3;
3
4 contract Counter {
5     uint public count;
6
7     // Function to get the current count
8     function get() public view returns (uint) {
9         return count;
10    }
11
12    // Function to increment count by 1
13    function inc() public {
14        count += 1;
15    }
16
17    // Function to decrement count by 1
18    function dec() public {
19        count -= 1;
20    }
21 }
```

## Tutorial 2: Basic Syntax

The screenshot shows the Remix IDE interface. On the left, the 'LEARNETH' sidebar is open, displaying the '2. Basic Syntax' tutorial. The 'MyContract' contract is selected, and its transaction log shows a successful call. The main editor displays the Solidity code for the 'MyContract' contract, which includes a public state variable 'name' of type string. The bottom panel shows the transaction log with a call to 'MyContract.get()'.

```
1 // SPDX-License-Identifier: MIT
2 // compiler version must be greater than or equal to 0.8.3 and less than 0.9.0
3 pragma solidity ^0.8.3;
4
5 contract MyContract {
6     string public name = "Alice";
7 }
```

## Tutorial 3: Primitive Data Types

**LEARNETH** 1.5.1

**3. Primitive Data Types** 3 / 19

You can learn more about these data types as well as *Fixed Point Numbers, Byte Arrays, Strings*, and more in the *Solidity documentation*.

Later in the course, we will look at data structures like **Mappings**, **Arrays**, **Enums**, and **Structs**.

Watch a video tutorial on [Primitive Data Types](#).

★ **Assignment**

1. Create a new variable `newAddr` that is a `public address` and give it a value that is not the same as the available variable `addr`.
2. Create a `public` variable called `neg` that is a negative number, decide upon the type.
3. Create a new variable, `newU` that has the smallest `uint` size type and the smallest `uint` value and is `public`.

Tip: Look at the other address in the contract or search the internet for an Ethereum address.

**Check Answer** **Show answer**

Next

Well done! No errors.

**primitiveDataTypes.sol**

```
20 // Negative numbers are allowed for int types.
21 // Like uint, different ranges are available from int8 to int256
22 //
23 int8 public i8 = -1;
24 int public i256 = 456;
25 int public i = -123; // int is same as int256
26
27
28 address public addr = 0xCA35b7d915458EF540aDe6068dFe2F44E8fa733c;
29
30 // Default values
31 // Unassigned variables have a default value
32 bool public defaultBool; // false
33 uint public defaultUint; // 0
34 int public defaultInt; // 0
35 address public defaultAddr; // 0x0000000000000000000000000000000000000000
36
37 // New values
38 address public newAddr = 0x0000000000000000000000000000000000000000;
39 int public neg = -12;
40 uint8 public newU = 0;
```

**Explain contract**

0 Listen on all transactions

CALL [call] from: 0x58380a6a701c568545dcfc803fc8875f56beddC4 to: Counter.get() data: 0x6d4...ce63c

## Tutorial 4: Variables

**LEARNETH** 1.5.1

**4. Variables** 4 / 19

addresses, contracts, and transactions.

In this example, we use `block.timestamp` (line 14) to get a Unix timestamp of when the current block was generated and `msg.sender` (line 15) to get the caller of the contract function's address.

A list of all Global Variables is available in the *Solidity documentation*.

Watch video tutorials on [State Variables](#), [Local Variables](#), and [Global Variables](#).

★ **Assignment**

1. Create a new public state variable called `blockNumber`.
2. Inside the function `doSomething()`, assign the value of the current block number to the state variable `blockNumber`.

Tip: Look into the global variables section of the *Solidity documentation* to find out how to read the current block number.

**Check Answer** **Show answer**

Next

Well done! No errors.

**variables.sol**

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.3;
3
4 contract Variables {
5     // State variables are stored on the blockchain.
6     string public text = "Hello";
7     uint public num = 123;
8     uint public blockNumber;
9
10    function doSomething() public { 22334 gas
11        // Local variables are not saved to the blockchain.
12        uint i = 456;
13
14        // Here are some global variables
15        uint timestamp = block.timestamp; // Current block timestamp
16        address sender = msg.sender; // address of the caller
17        blockNumber = block.number;
18    }
19 }
```

Did you know? You can use the Recorder to record and replay your transactions to any network from the Deploy and Run plugin.

## Tutorial 5: Functions - Reading and Writing to a State Variable

The screenshot shows the REMIX IDE interface for Tutorial 5. The sidebar on the left displays the tutorial list, with '5.1 Functions - Reading and Writing to a State Variable' selected. The main editor shows the Solidity code for a contract named 'SimpleStorage'. The code includes a state variable 'num' of type 'uint', a 'set' function to update 'num', and a 'get' function to return 'num'. The console at the bottom shows a transaction call to 'Counter.get()' with data '0x6d4...ce63c'.

```
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.3;
3
4 contract SimpleStorage {
5     // State variable to store a number
6     uint public num;
7     bool public b = true;
8
9     // You need to send a transaction to write to a state variable.
10    function set(uint _num) public { 22536 gas
11        num = _num;
12    }
13
14    // You can read from a state variable without sending a transaction.
15    function get() public view returns (uint) { 2475 gas
16        return num;
17    }
18
19    function get_b() public view returns (bool) { 2539 gas
20        return b;
21    }
22 }
```

**Tutorials list** **Syllabus**

**5.3 Functions - Modifiers and Constructors** 7 / 19

parameters and is especially useful when you don't know certain initialization values before the deployment of the contract.

You declare a constructor using the `constructor` keyword. The constructor in this contract (line 11) sets the initial value of the owner variable upon the creation of the contract.

Watch a video tutorial on Function Modifiers.

★ **Assignment**

1. Create a new function, `increaseX` in the contract. The function should take an input parameter of type `uint` and increase the value of the variable `x` by the value of the input parameter.
2. Make sure that `x` can only be increased.
3. The body of the function `increaseX` should be empty.

Tip: Use modifiers.

**5.4 Functions - Inputs and Outputs** 8 / 19

the input and output parameters of contract functions.

"[Mappings] cannot be used as parameters or return parameters of contract functions that are publicly visible." From the Solidity documentation.

Arrays can be used as parameters, as shown in the function `arrayInput` (line 71). Arrays can also be used as return parameters as shown in the function `arrayOutput` (line 76).

You have to be cautious with arrays of arbitrary size because of their gas consumption. While a function using very large arrays as inputs might fail when the gas costs are too high, a function using a smaller array might still be able to execute.

Watch a video tutorial on Function Outputs.

★ **Assignment**

Create a new function called `returnTwo` that returns the values `-2` and `true` without using a return statement.

## Tutorial 9: Visibility

**LEARNETH** 1.5.1 learneth tutorials

**6. Visibility** 9 / 19

- State variables can not be `external`

In this example, we have two contracts, the `Base` contract (line 4) and the `Child` contract (line 55) which inherits the functions and state variables from the `Base` contract.

When you uncomment the `testPrivateFunc` (lines 58-60) you get an error because the child contract doesn't have access to the private function `privateFunc` from the `Base` contract.

If you compile and deploy the two contracts, you will not be able to call the functions `privateFunc` and `internalFunc` directly. You will only be able to call them via `testPrivateFunc` and `testInternalFunc`.

Watch a video tutorial on Visibility.

★ **Assignment**

Create a new function in the `Child` contract called `testInternalVar` that returns the values of all state variables from the `Base` contract that are possible to return.

[Check Answer](#) [Show answer](#)

Next

Well done! No errors.

```
43 // function testExternalFunc() public pure returns (string memory) {
44 //     return externalFunc();
45 // }

## Tutorial 10: Control Flow - If/Else

**LEARNETH** 1.5.1 learneth tutorials

**7.1 Control Flow - If/Else** 10 / 19

**else if**

With the `else if` statement we can combine several conditions.

If the first condition (line 6) of the `foo` function is not met, but the condition of the `else if` statement (line 8) becomes true, the function returns `1`.

Watch a video tutorial on the If/Else statement.

★ **Assignment**

Create a new function called `evenCheck` in the `ifelse` contract:

- That takes in a `uint` as an argument.
- The function returns `true` if the argument is even, and `false` if the argument is odd.
- Use a ternary operator to return the result of the `evenCheck` function.

Tip: The modulo (%) operator produces the remainder of an integer division.

[Check Answer](#) [Show answer](#)

## Tutorial 11: Control Flow - Loops

**LEARNETH** 1.5.1 learneth tutorials

**Tutorials list** 7.2 Control Flow - Loops 11 / 19

The `continue` statement is used to skip the remaining code block and start the next iteration of the loop. In this contract, the `continue` statement (line 10) will prevent the second if statement (line 12) from being executed.

**break**

The `break` statement is used to exit a loop. In this contract, the break statement (line 14) will cause the for loop to be terminated after the sixth iteration.

Watch a video tutorial on Loop statements.

★ **Assignment**

1. Create a public `uint` state variable called `count` in the `Loop` contract.
2. At the end of the for loop, increment the count variable by 1.
3. Try to get the count variable to be equal to 9, but make sure you don't edit the `break` statement.

**Check Answer** **Show answer**

## Tutorial 12: Data Structures - Arrays

**LEARNETH** 1.5.1 learneth tutorials

**Tutorials list** 8.1 Data Structures - Arrays 12 / 19

when we remove an element with the `delete` operator all other elements stay the same, which means that the length of the array will stay the same. This will create a gap in our array. If the order of the array is not important, then we can move the last element of the array to the place of the deleted element (line 46), or use a mapping. A mapping might be a better choice if we plan to remove elements in our data structure.

**Array length**

Using the `length` member, we can read the number of elements that are stored in an array (line 35).

Watch a video tutorial on Arrays.

★ **Assignment**

1. Initialize a public fixed-sized array called `arr3` with the values 0, 1, 2. Make the size as small as possible.
2. Change the `getArr()` function to return the value of `arr3`.

**Check Answer** **Show answer**

Well done! No errors.

```
40 // Delete does not change the array length.
41 // It resets the value at index to it's default value,
42 // in this case 0
43 delete arr[index];
44 }
45 }
46
47 contract CompactArray {
48     uint[] public arr;
49
50     // Deleting an element creates a gap in the array.
51     // One trick to keep the array compact is to
52     // move the last element into the place to delete.
53     function remove(uint index) public {
54         // Move the last element into the place to delete
55         arr[index] = arr[arr.length - 1];
56         // Remove the last element
57         arr.pop();
58     }
59
60     function test() public {
61         arr.push(1);
62         arr.push(2);
63         arr.push(3);
64         arr.push(4);
65         // [1, 2, 3, 4]
66
67         remove(1);
68         // [1, 4, 3]
69
70         remove(2);
71         // [1, 4]
72     }
73 }
```

```
11 return balances[_addr];
12 }
13
14 function set(address _addr) public { 25256 gas
15 // Update the value at this address
16 balances[_addr] = _addr.balance;
17 }
18
19 function remove(address _addr) public { 5566 gas
20 // Reset the value to the default value.
21 delete balances[_addr];
22 }
23
24
25 contract NestedMapping {
26 // Nested mapping (mapping from address to another mapping)
27 mapping(address => mapping(uint => bool)) public nested;
28
29 function get(address _addr1, uint _i) public view returns (bool) { 3159 gas
30 // You can get values from a nested mapping
31 // even when it is not initialized
32 return nested[_addr1][_i];
33 }
34
35 function set( 25199 gas
36 address _addr1,
37 uint _i,
38 bool _boo
39 ) public {
40 nested[_addr1][_i] = _boo;
41 }
42
43 function remove(address _addr1, uint _i) public { 25045 gas
44 delete nested[_addr1][_i];
45 }
46 }
```

mapping's name and key in brackets and assigning it a new value (line 16).

### Removing values

We can use the delete operator to delete a value associated with a key, which will set it to the default value of 0. As we have seen in the arrays section.

Watch a video tutorial on Mappings.

### Assignment

1. Create a public mapping `balances` that associates the key type `address` with the value type `uint`.
2. Change the functions `get` and `remove` to work with the mapping balances.
3. Change the function `set` to create a new entry to the balances mapping, where the key is the address of the parameter and the value is the balance associated with the address of the parameter.

structs.sol

```
16 todos.push({text: _text, completed: false});
17
18 // key value mapping
19 todos.push(Todo({text: _text, completed: false}));
20
21 // initialize an empty struct and then update it
22 Todo memory todo;
23 todo.text = _text;
24 // todo.completed initialized to false
25
26 todos.push(todo);
27
28
29 // Solidity automatically created a getter for 'todos' so
30 // you don't actually need this function.
31 function get(uint _index) public view returns (string memory text, bool completed)
32 {
33     Todo storage todo = todos[_index];
34     return (todo.text, todo.completed);
35 }
36
37 // update text
38 function update(uint _index, string memory _text) public { infinite gas
39     Todo storage todo = todos[_index];
40     todo.text = _text;
41 }
42
43 // update completed
44 function toggleCompleted(uint _index) public { 28995 gas
45     Todo storage todo = todos[_index];
46     todo.completed = !todo.completed;
47 }
48
49 function remove(uint _index) public { infinite gas
50     delete todos[_index];
51 }
```

parameters in parentheses (line 16).

Key-value mapping: We provide the name of the struct and the keys and values as a mapping inside curly braces (line 19).

Initialize and update a struct: We initialize an empty struct first and then update its member by assigning it a new value (line 23).

### Accessing structs

To access a member of a struct we can use the dot operator (line 33).

### Updating structs

To update a structs' member we also use the dot operator and assign it a new value (lines 39 and 45).

Watch a video tutorial on Structs.

### Assignment

Create a function `remove` that takes a `uint` as a parameter and deletes a struct member with the given index in the `todos` mapping.

## Tutorial 15: Data Structures - Enums

remix.ethereum.org/?#activate=udapp,solidity,LearnEth&lang=en&optimize&runs=200&evmVersion=soljson-v0.8.31+commit.fd3a2265.js

REMUX 1.5.1 learneth tutorials

LEARNETH

Tutorials list Syllabus

8.4 Data Structures - Enums 15 / 19

We can update the enum value of a variable by assigning it the `uint` representing the enum member (line 30). Shipped would be 1 in this example. Another way to update the value is using the dot operator by providing the name of the enum and its member (line 35).

### Removing an enum value

We can use the delete operator to delete the enum value of the variable, which means as for arrays and mappings, to set the default value to 0.

Watch a video tutorial on Enums.

### Assignment

1. Define an enum type called `Size` with the members `S`, `M`, and `L`.
2. Initialize the variable `sizes` of the enum type `Size`.
3. Create a getter function `getSize()` that returns the value of the variable `sizes`.

Check Answer Show answer

Next

```
12
13
14
15 enum Size {
16     S,
17     M,
18     L
19 }
20
21 // Default value is the first element listed in
22 // definition of the type, in this case "Pending"
23 Status public status;
24 Size public sizes;
25
26 function get() public view returns (Status) {
27     return status;
28 }
29
30 function getSize() public view returns (Size) {
31     return sizes;
32 }
33
34 // Update status by passing uint into input
35 function set(Status _status) public {
36     status = _status;
37 }
38
39 // You can update to a specific enum like this
40 function cancel() public {
41     status = Status.Canceled;
42 }
43
44 // delete resets the enum to its first value, 0
45 function reset() public {
46     delete status;
47 }
```

## Tutorial 16: Data Locations

## Tutorial 17: Transactions - Ether and Wei

REMIX 1.5.1 learneth tutorials

LEARNETH

Tutorials list

10.1 Transactions - Ether and Wei

Wei is the smallest subunit of *Ether*, named after the cryptographer Wei Dai. *Ether* numbers without a suffix are treated as *wei* (line 7).

One *gwei* (giga-wei) is equal to 1,000,000,000 ( $10^9$ ) *wei*.

One *ether* is equal to 1,000,000,000,000,000 ( $10^{18}$ ) *wei* (line 11).

Watch a video tutorial on Ether and Wei.

★ Assignment

1. Create a `public uint` called `oneGwei` and set it to 1 *gwei*.
2. Create a `public bool` called `isOneGwei` and set it to the result of a comparison operation between 1 *gwei* and  $10^9$ .

Tip: Look at how this is written for *gwei* and *ether* in the contract.

## Tutorial 18: Transactions - Gas and Gas Price

REMIX 1.5.1 learneth tutorials

LEARNETH

Tutorials list

10.2 Transactions - Gas and Gas Price

Gas limit

When sending a transaction, the sender specifies the maximum amount of gas that they are willing to pay for. If they set the limit too low, their transaction can run out of gas before being completed, reverting any changes being made. In this case, the gas was consumed and can't be refunded.

Learn more about gas on [ethereum.org](https://ethereum.org).

Watch a video tutorial on Gas and Gas Price.

★ Assignment

Create a new `public` state variable in the `Gas` contract called `cost` of the type `uint`. Store the value of the gas cost for deploying the contract in the new variable, including the cost for the value you are storing.

Tip: You can check in the Remix terminal the details of a transaction, including the gas cost. You can also use the Remix plugin *Gas Profiler* to check for the gas cost of transactions.

4 contract Gas {
5     uint public i = 0;
6     uint public cost = 170367;
7
8     // Using up all of the gas that you send causes your transaction to fail.
9     // State changes are undone.
10    // Gas spent are not refunded.
11    function forever() public { Infinite gas
12        // Here we run a loop until all of the gas are spent
13        // and the transaction fails
14        while (true) {
15            i += 1;
16        }
17    }
18 }
```

Scan Alert Initialize as git repo Did you know? You can use the Recorder to record and replay your transactions to any network from the Deploy and Run plugin.

## Tutorial 19: Transactions - Sending Ether

The screenshot displays the Remix IDE interface during a tutorial. The left sidebar, titled 'LEARNETH', shows the '10.3 Transactions - Sending Ether' tutorial. It includes instructions on using `transfer()` or `send()`, a video tutorial link, and an 'Assignment' section with four steps: creating a contract, adding a public state variable, creating a donate function, and creating a withdraw function. The main editor shows the Solidity code for a 'Charity' contract. The code includes functions for sending ether via `transfer`, `send`, `sendViaSend`, and `sendViaCall`, and a `withdraw` function. The status bar at the bottom indicates 'Well done! No errors.' and 'Explain contract'.

```
function sendViaTransfer(address payable _to) public payable {  
    // This function is no longer recommended for sending Ether.  
    _to.transfer(msg.value);  
}  
  
function sendViaSend(address payable _to) public payable {  
    // Send returns a boolean value indicating success or failure.  
    // This function is not recommended for sending Ether.  
    bool sent = _to.send(msg.value);  
    require(sent, "Failed to send Ether");  
}  
  
function sendViaCall(address payable _to) public payable {  
    // Call returns a boolean value indicating success or failure.  
    // This is the current recommended method to use.  
    (bool sent, bytes memory data) = _to.call(value: msg.value)("");  
    require(sent, "Failed to send Ether");  
}  
  
contract Charity {  
    address public owner;  
  
    constructor() {  
        owner = msg.sender;  
    }  
  
    function donate() public payable {  
  
    }  
  
    function withdraw() public {  
        uint amount = address(this).balance;  
  
        (bool sent, bytes memory data) = owner.call{value: amount}("");  
        require(sent, "Failed to send Ether");  
    }  
}
```

## CONCLUSION:

Through this experiment, the basic concepts of Solidity programming were learned by completing practical assignments using the Remix IDE. Important topics such as data types, variables, different types of functions, visibility, modifiers, constructors, control flow statements, data structures, and transactions were studied and applied while creating smart contracts. The hands-on practice helped in understanding how to design, compile, and deploy contracts using the Remix VM. Overall, this experiment helped in building a clear understanding of blockchain concepts and provided a strong foundation for developing and managing smart contracts effectively.
